

The chart displays the daily count of COVID-19 cases in the United States. The data is segmented by year: 2020 (brown), 2021 (orange), and 2022 (blue). The y-axis scale goes up to 100,000 cases. The x-axis marks specific months: March, May, July, September, and November for each year. The 2020 section shows several waves of infection, with a major peak in late 2020. The 2021 section shows a very high and sustained level of cases, reaching the 100,000 mark multiple times. The 2022 section, though only showing the first few months, continues the high volume of cases.
